Report of “World Pneumonia Day -12th november 2023” :

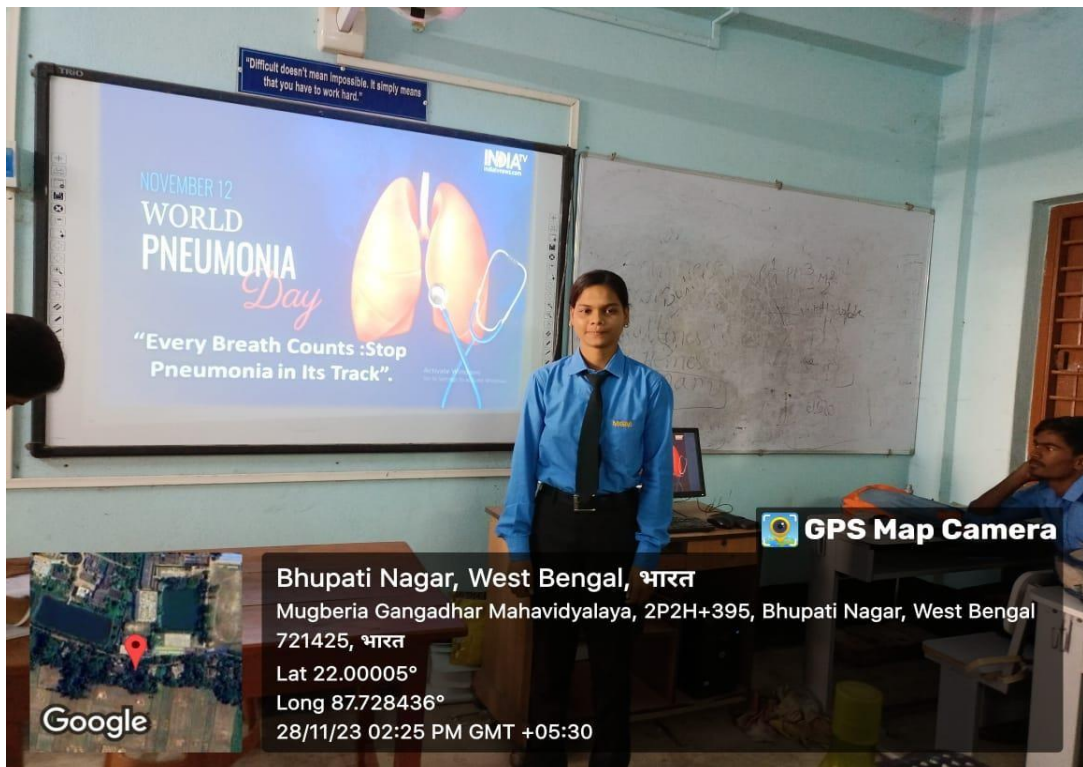

World Pneumonia Day has been observed every year on November 12 since 2009. The Day is meant to spread awareness and educate people, governments, and other stakeholders to take action to combat pneumonia on all fronts. Pneumonia is an infection of the lungs caused by bacteria, viruses, or fungi. It can be life-threatening particularly in children and the elderly. The theme of the World Pneumonia Day 2023 highlights the significance of every breath and underscores the importance and urgency of stopping pneumonia through early detection, treatment, and prevention. Early detection and treatment are key to the prevention of complications and reduction of morbidity. Pneumonia can be prevented by vaccination, adequate nutrition, and particularly in children addressing environmental factors like indoor air pollution, proper ventilation, and parental smoking.

Significance of World Pneumonia Day

Pneumonia, characterised by inflammation of the lungs, can be caused by bacteria, viruses, or fungi. Despite being treatable and preventable, pneumonia continues to pose a substantial threat to vulnerable populations, especially in developing countries with limited access to healthcare. By observing World Pneumonia Day, we emphasise the importance of vaccination, early detection, and timely intervention to mitigate the impact of pneumonia on individuals and communities.

The program started with the speech of departmental teachers. After that student of B.Sc. 5th sem Raikamal Bera present her topic “Management of Pneumonia” through PPT. There was 16 students and two teachers present. Programme was successfully ended.
